
Charmless 2-body B decays in SCET

Jure Zupan

Carnegie Mellon University

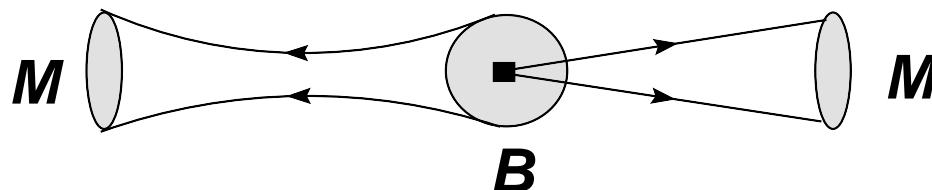

based on A. Williamson, J.Z., hep-ph/0601214

B decays/motivation

- *B* decays probe flavor dynamics of SM (or extensions)
 - KM description of CP violation?
 - enhanced flavor transitions (e.g. new FCNC...)
- an abundance of information available from Belle and BaBar
- the weak dynamics folded with the QCD effects
 - some calculable from first principles using lattice QCD: $f_B, f_\pi, F_{+,0}^{B \rightarrow \pi}$
 - use symmetries to simplify problems: isospin, $SU(3)_F$
 - use $1/m_b$ expansion: HQET, SCET

Charmless B decays

- B decays into two light mesons: $B \rightarrow \pi\pi, B \rightarrow \pi K, \dots$
- the outgoing mesons look like 2 energetic jets with $p^2 \sim \Lambda_{\text{QCD}}$

- can use Soft Collinear Effective Theory to treat QCD effects

Outline

- brief introduction to SCET
 - application to 2-body charmless B decays
 - extension to isosinglet final states
- phenomenology
 - $B \rightarrow \pi K$ puzzle
 - $B^0 \rightarrow \eta' K$ vs. $B \rightarrow \eta K$
 - S parameters in penguin dominated modes
- if time permits...
 - B_s decays
 - semiinclusive hadronic decays
- conclusions

Introduction to SCET

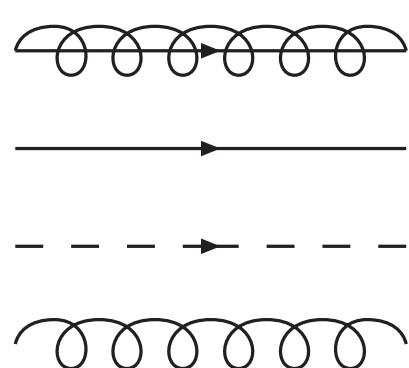

Bauer, Fleming, Luke, Pirjol, Stewart 2000,2001

- effective theory appropriate for jet-like events in QCD
- jet in z direction \Rightarrow use light-cone coord.

$$p^\mu = (E + p_3, E - p_3, \vec{p}_\perp) = (p_+, p_-, \vec{p}_\perp)$$

Note: $p^2 = p_+ p_- - \vec{p}_\perp^2$

- orig. app.: endpoint region of $B \rightarrow X_s \gamma, X_u l \nu$
 - expansion parameter $\sqrt{\lambda} = \sqrt{\Lambda/m_b}$ ($p_X^2 = \Lambda m_b$)
 - the IR behaviour of QCD is reproduced by:

collinear gluon, $p \sim m_B(1, \lambda, \sqrt{\lambda})$

collinear quark, $p \sim m_B(1, \lambda, \sqrt{\lambda})$

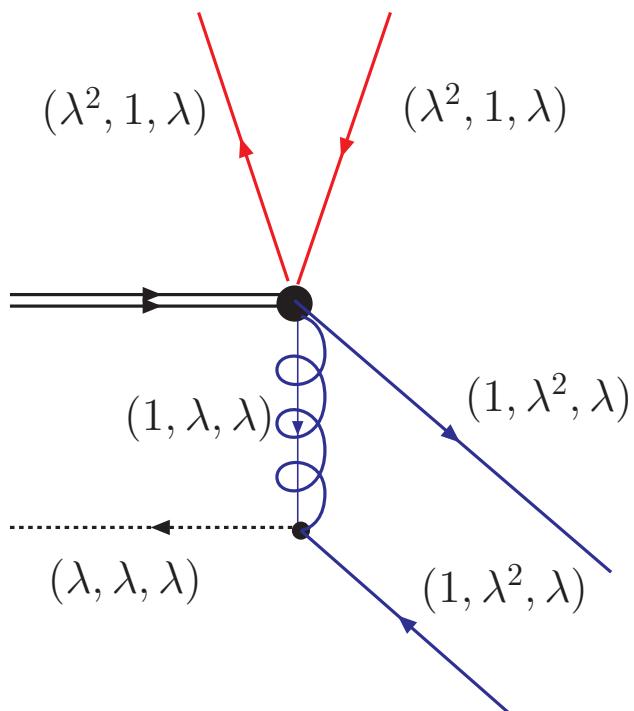

soft quark, $p \sim m_B(\lambda, \lambda, \lambda)$

soft gluon, $p \sim m_B(\lambda, \lambda, \lambda)$

Scales in charmless 2-body B decay

Bauer, Pirjol, Stewart 2002

- outgoing states are jet-like with $p^2 = \Lambda^2$
- the "brown muck" in B is soft
- a typical configuration

- intermediate hard-collinear modes: $p^2 = m_B^2 \lambda = m_B \Lambda$
- assume ordering
 $\Lambda \ll \sqrt{m_B \Lambda} \ll m_B$
- two step matching
 - $\text{QCD} \rightarrow \text{SCET}_I$
⇐ expan. param. $\sqrt{\lambda}$
 - $\text{SCET}_I \rightarrow \text{SCET}_{II}$
⇐ expan. param. λ

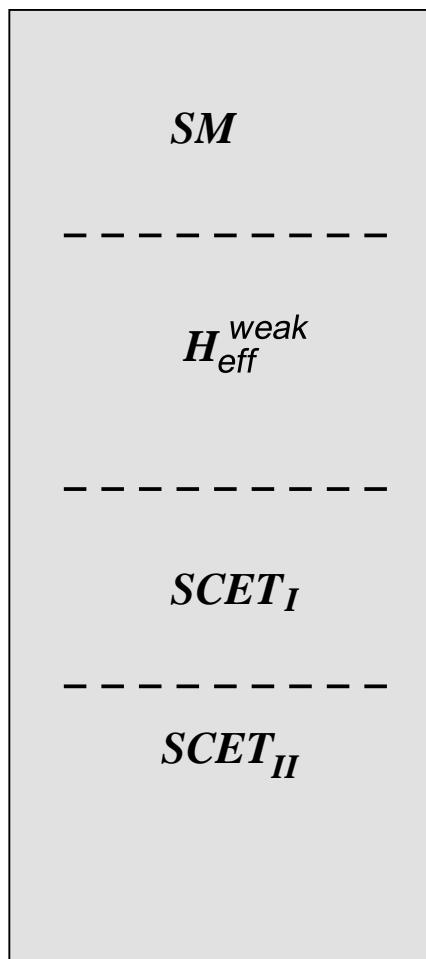

Effective theories in 2-body B decays

Bauer, Pirjol, Rothstein, Stewart 2004

Bauer, Rothstein, Stewart 2005

Williamson, JZ 2006

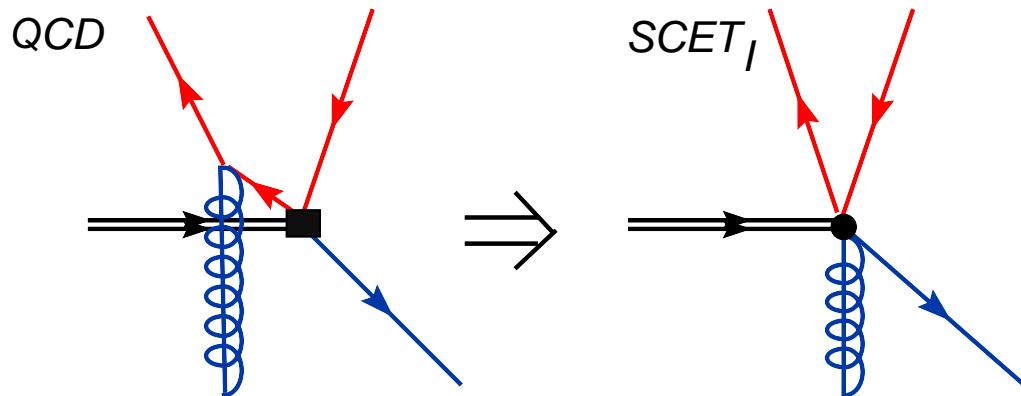

- a sequence of effective theories

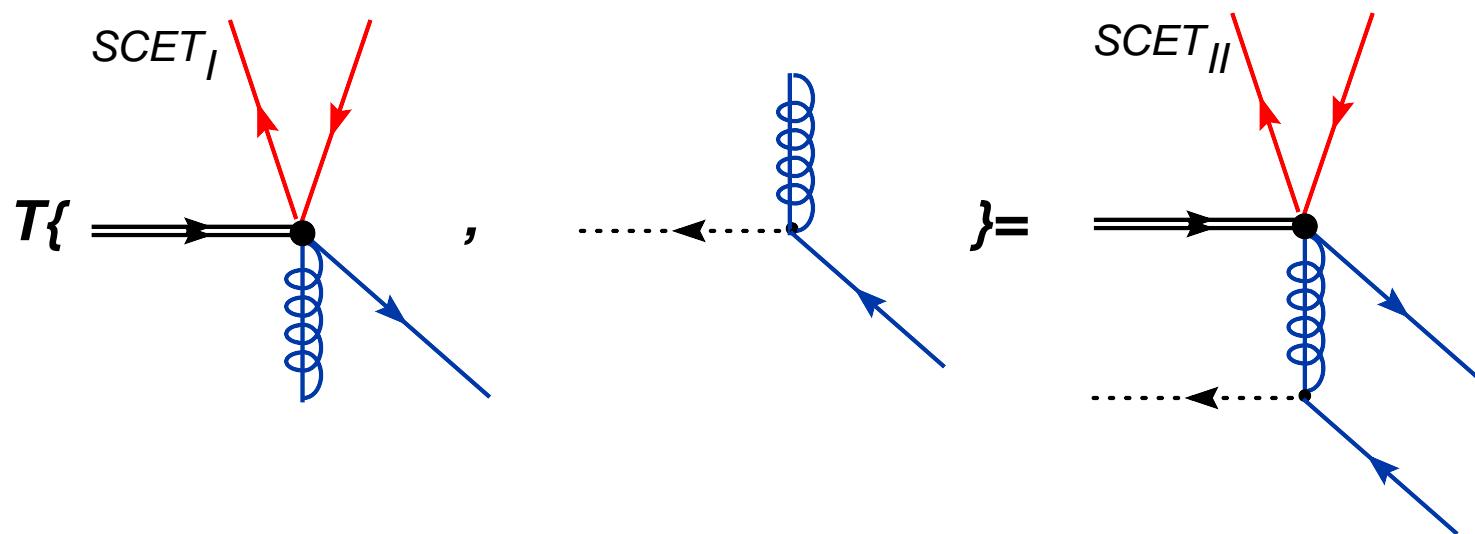

- $H_{\text{eff}}^{\text{weak}}$ in terms of four quark operators $O_i \sim (\bar{q}\Gamma_i q')(\bar{q}''\Gamma'_i q''')$ and magnetic operators
- in SCET_I at LO in $1/m_B$ factorization of collinear modes in opposite directions $O_i \sim (\bar{q}_n\Gamma_i q'_n) \times (\bar{q}'_{\bar{n}}\Gamma'_i q'''_{\bar{n}})$
- these then match to nonlocal operators in SCET_{II}

Matching examples

- example of QCD \rightarrow SCET_I matching

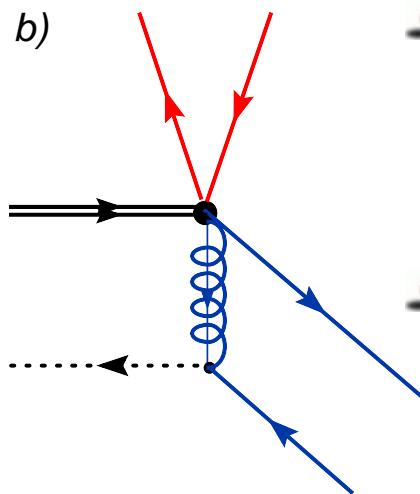

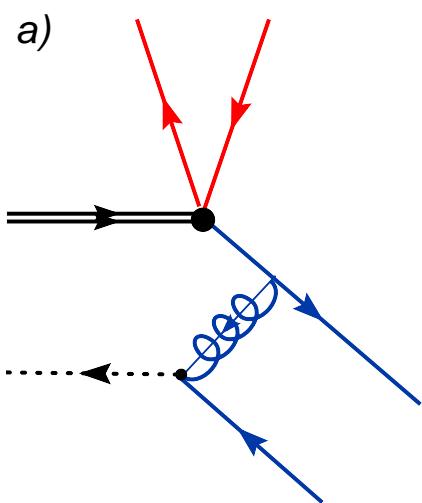

- example of SCET_I \rightarrow SCET_{II} matching

Factorization formula

Bauer, Pirjol, Rothstein, Stewart 2004

- for start only nonisosinglet final states (such as $B \rightarrow \pi\pi$)
- $\text{SCET}_I \rightarrow \text{SCET}_{II}$ matching

- a) type diagrams have endpoint singularities \Rightarrow introd. matrix el. ζ^{BM}
- b) type diagrams, $\alpha_S(\sqrt{\Lambda, m_B})$ expansion of function $\zeta_J^{BM}(z)$

- at LO in $1/m_B$

$$A(B \rightarrow M_1 M_2) \propto f_{M_1} \phi_{M_1}(u) \otimes T_{1J}(u, z) \otimes \zeta_J^{BM_2}(z) + f_{M_1} \phi_{M_1}(u) \otimes T_{1\zeta}(u) \zeta^{BM_2} + 1 \leftrightarrow 2 + \lambda_c^{(f)} A_{cc}^{M_1 M_2}$$

At LO in $\alpha_S(m_b)$

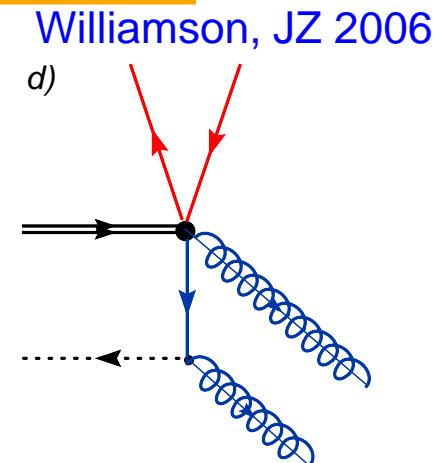

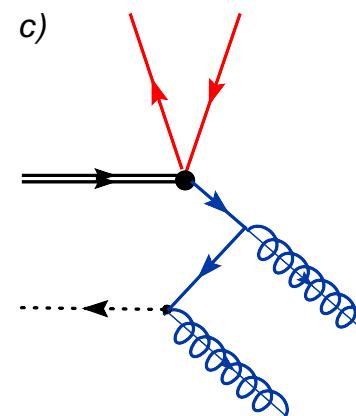

- hard kernels $T_{1(J),2(J)}(u, z)$ are calculable in $\alpha_S(m_b)$ expansion
- at LO in $\alpha_S(m_b)$
 - $T_{1,2}$ are constants
 - $T_{1J,2J}$ only functions of u
- this simplifies the factorization formula

$$A_{B \rightarrow M_1 M_2} \propto f_{M_1} \phi_{M_1}(u) \otimes T_{1J}(u) \zeta_J^{BM_2} + f_{M_1} T_{1J} \zeta^{BM_2} + 1 \leftrightarrow 2 + \lambda_c^{(f)} A_{cc}^{M_1 M_2}$$

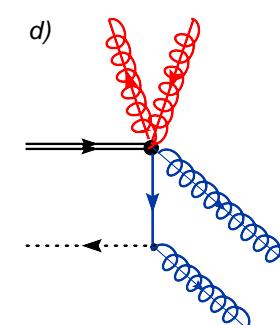

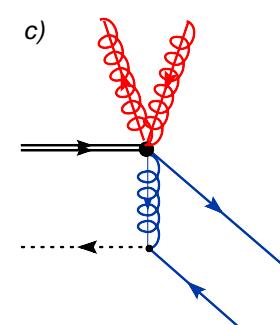

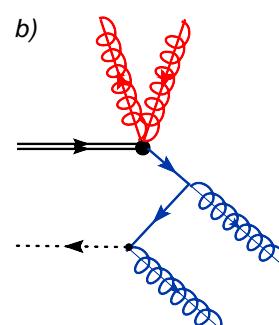

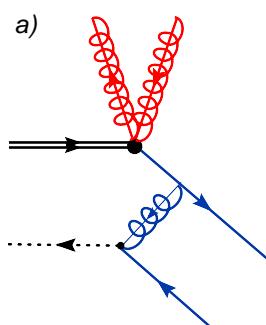

- coefficients ζ^{BM} , ζ_J^{BM} are fit from data

Isosinglet final states

- additional operators in $\text{SCET}_I \rightarrow \text{SCET}_{II}$ matching, that contribute only for η, η'

- at $\alpha_S(m_b)$ also operators (at this order only from O_{8g})

- at LO in $\alpha_S(m_b)$ the same factor. formula as before
 - $\zeta^{B\eta^{(')}}, \zeta_J^{B\eta^{(')}}$ receive contribs. from gluonic operators

Connection to form factors

- ζ^{BM}, ζ_J^{BM} are related to $B \rightarrow M$ form factors
- at LO in $\alpha_S(m_b)$ for decays into pseudoscalars

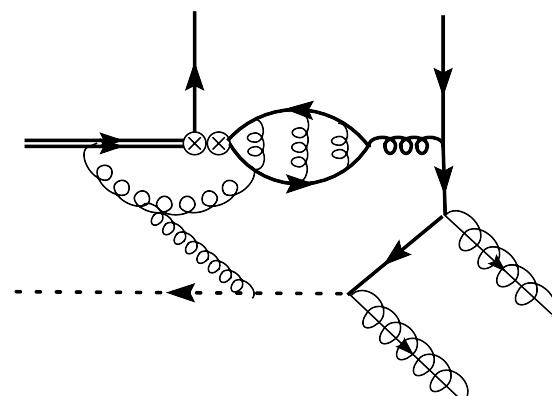

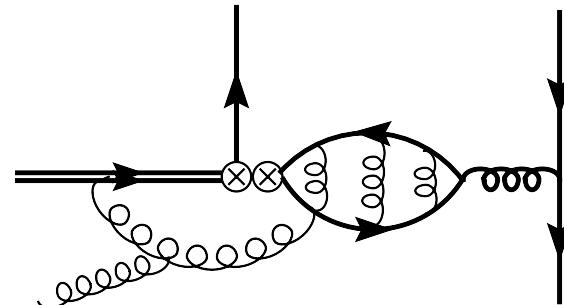

$$f_+^{BP}(0) = \zeta^{BP} + \zeta_J^{BP}$$

$$f_+^{BP}(0) + f_-^{BP}(0) = 2\zeta_J^{BP}$$

- at higher orders in $\alpha_S(m_b)$ more complicated hard kernels
- these nonperturbative inputs could be
 - obtained from lattice (+ exp. data on $B \rightarrow \pi l \nu$)
 - from sum rules
 - in our analysis will be fit from $B \rightarrow PP$ data

Charming penguins

- since $2m_c \sim m_b$ there are configurations with almost on-shell charm quarks
- BBNS: charming penguins perturbative
- BPRS: nonpert., NRQCD counting $\alpha_S(2m_c)f(2m_c/m_b)v$
- most conservative - introduce new nonpert. parameters $A_{cc}^{M_1 M_2}$ that are fit from data (with isospin or SU(3) used)
- for isosinglets also "gluonic charming penguins"
⇒ in SU(3) limit one additional parameter A_{ccg}

Counting of parameters

- assuming only isospin at LO in $1/m_b$ and $\alpha_S(m_b)$
 - $B \rightarrow \pi\pi$: 4 real parameters $\zeta_{(J)}^{B\pi}, A_{cc}^{\pi\pi}$ vs. 8 observables (6 measured)
 - $B \rightarrow \pi\eta^{(')}$: 8 new parameters $\zeta_{(J)}^{B\eta_{q,s}}, A_{cc}^{\pi\eta_{q,s}}$ beyond $B \rightarrow \pi\pi$ vs. 19 observables (4 measured)
 - similarly $B \rightarrow \pi K$ vs. $B \rightarrow K\eta^{(')}$
- at present in the analysis of isosinglets SU(3) needs to be used (this can be relaxed with more data)
- in the SU(3) limit 8 real parameters: ζ, ζ_J, A_{cc} and the "gluonic" $\zeta_g, \zeta_{Jg}, A_{ccg}$ (these only for isosinglets)
- compare with 18 complex reduced matrix elements in most general SU(3) decomposition

Phenomenology

Overview

Williamson, JZ 2006

- will focus on $B \rightarrow PP$, work at LO in $1/m_b$ and $\alpha_S(m_b)$
- isosinglets included, at present SU(3) imposed on SCET parameters
- LO factorized amplitude

$$A_{B \rightarrow M_1 M_2} \propto f_{M_1} \phi_{M_1}(u) \otimes T_{1J}(u) \zeta_J^{BM_2}$$
$$+ f_{M_1} T_{1J} \zeta^{BM_2} + 1 \leftrightarrow 2 + \lambda_c^{(f)} A_{cc}^{M_1 M_2}$$

- two subsequent fits determine SCET parameters
 - $\zeta_{(J)}$, A_{cc} from $B \rightarrow \pi\pi, \pi K$
 - $\zeta_{(J)g}$, A_{ccg} from $B \rightarrow \eta^{(')}\pi, \eta^{(')}K$
- in predictions SU(3) and $1/m_b$ errors included with parametrically expected sizes

$B \rightarrow \pi K$ "puzzle"

General considerations

- define "tree" and "penguin" according to CKM factors

$$A_{\bar{B} \rightarrow f} = \lambda_u^{(s)} T_{\bar{B} \rightarrow f} + \lambda_c^{(s)} P_{\bar{B} \rightarrow f}$$

where $\lambda_u^{(d)} = V_{ub}V_{ud}^*$, $\lambda_u^{(s)} = V_{ub}V_{us}^*$

- in $\Delta S = 1$ large hierarchy between T, P since $|\lambda_u^{(s)}| \sim 0.02 |\lambda_c^{(s)}|$
- the dominant term in $B \rightarrow K\pi$ is charming penguin $A_{cc}^{K\pi}$ which is $\lambda_c^{(s)}/\lambda_u^{(s)}$ enhanced over tree
- this leads to approximate relations

$$\begin{aligned} Br_{\pi^+ K^-} &\simeq Br_{\pi^- \bar{K}^0} & \simeq 2Br_{\pi^0 K^-} &\simeq 2Br_{\pi^0 \bar{K}^0} \\ 18.9 \pm 0.7 &\simeq 24.1 \pm 1.8 &\simeq 24.2 \pm 1.6 &\simeq 23.0 \pm 2.0 \end{aligned}$$

Determination of SCET parameters

- from the χ^2 -fit to the $B \rightarrow \pi\pi, K\pi$ data we then obtain $\zeta, \zeta_J, |A_{cc}|$ and $\arg(A_{cc})$
- $\zeta \sim \zeta_J$ as expected from SCET counting
- strong phase in A_{cc} is nonzero:
$$\arg(A_{cc}) = 156^\circ \pm 6^\circ$$
- $\chi^2/\text{d.o.f.} = 44.6/(13 - 4)$ is large since theory errors larger from the experimental. If theory errors added quadratically to exp. errors $\Rightarrow \chi^2/\text{d.o.f.} = 8.9/(13 - 4)$
- the largest discrepancies are

$$\mathcal{A}_{\pi^0 K^-}^{\text{CP}} \stackrel{\text{Th.}}{=} -0.11 \pm 0.09 \pm 0.11 \pm 0.02 \stackrel{\text{Exp.}}{=} 0.04 \pm 0.04$$

$$\mathcal{A}_{\pi^- K^+}^{\text{CP}} \stackrel{\text{Th.}}{=} -0.06 \pm 0.05 \pm 0.06 \pm 0.02 \stackrel{\text{Exp.}}{=} -0.115 \pm 0.018$$

R ratios

- many errors cancel in the ratios of Br (for instance to large extent dependence on A_{cc})
- using obtained values of SCET parameters

$$R = \frac{\bar{\Gamma}(\bar{B}^0 \rightarrow K^- \pi^+)}{\bar{\Gamma}(B^- \rightarrow \bar{K}^0 \pi^-)} \stackrel{\text{Exp.}}{=} 0.84 \pm 0.07 \stackrel{\text{Th.}}{=} 1.037 \pm 0.047$$

$$R_c = 2 \frac{\bar{\Gamma}(B^- \rightarrow K^- \pi^0)}{\bar{\Gamma}(B^- \rightarrow \bar{K}^0 \pi^-)} \stackrel{\text{Exp.}}{=} 1.00 \pm 0.10 \stackrel{\text{Th.}}{=} 1.088 \pm 0.074$$

$$R_n = \frac{1}{2} \frac{\bar{\Gamma}(\bar{B}^0 \rightarrow K^- \pi^+)}{\bar{\Gamma}(\bar{B}^0 \rightarrow \bar{K}^0 \pi^0)} \stackrel{\text{Exp.}}{=} 0.82 \pm 0.08 \stackrel{\text{Th.}}{=} 1.069 \pm 0.078,$$

and

$$R_{00} = 2 \frac{\bar{\Gamma}(\bar{B}^0 \rightarrow \bar{K}^0 \pi^0)}{\bar{\Gamma}(B^- \rightarrow \bar{K}^0 \pi^-)} = \frac{R}{R_n} \stackrel{\text{Exp.}}{=} 1.03 \pm 0.12 \stackrel{\text{Th.}}{=} 0.970 \pm 0.036$$

R ratios

- especially interesting is the difference $R_n - R_c$
- expanding in tree/penguin and EWP/(charm. peng.) one gets

$$R_n = R_c + \dots$$

up to corrections of second order in small parameters

- numerically

$$(R_c - R_n) \stackrel{\text{Exp.}}{=} 0.18 \pm 0.13 \stackrel{\text{Th.}}{=} 0.018 \pm 0.013$$

Other tests

- similarly the Lipkin sum rule

$$\Delta L = R_{00} - R + R_c - 1 \stackrel{\text{Exp.}}{=} 0.19 \pm 0.14 \stackrel{\text{Th.}}{=} 0.020 \pm 0.012$$

is only of second order in the same expansion

- even more precise is

Atwood, Soni 1997; Gronau, 2004

$$\begin{aligned}\Delta_{\Sigma} = & 2\Delta\Gamma(B^- \rightarrow K^-\pi^0) - \Delta\Gamma(B^- \rightarrow \bar{K}^0\pi^-) \\ & + 2\Delta\Gamma(\bar{B}^0 \rightarrow \bar{K}^0\pi^0) - \Delta\Gamma(\bar{B}^0 \rightarrow K^-\pi^+)\end{aligned}$$

that does not depend on A_{cc}

- $\Delta_{\Sigma} = 0$ in the limit of exact isospin and no EWP
- for EWP $\neq 0$ still $\Delta_{\Sigma} = 0$ at LO in $1/m_B$ and $\alpha_S(m_b)$ since no relative strong phases

$B \rightarrow \pi\eta^{(')}$ and $B \rightarrow K\eta^{(')}$ decays

Determination of SCET parameters

- use ζ, ζ_J and A_{cc} from $B \rightarrow \pi\pi, \pi K$ fit
- ζ_g, ζ_{Jg} and A_{ccg} are obtained from fit to $B \rightarrow \eta^{(')}\pi, \eta^{(')}K$ data on Br and $A_{CP} \Leftarrow$ no use of S parameters is made

- 2 solutions obtained that differ by

$$\arg(A_{ccg}) = -109^\circ \pm 3^\circ$$

$$\arg(A_{ccg}) = -68^\circ \pm 4^\circ$$

- the two solutions can be resolved by future measurm. of $A_{CP}(\eta K^-)$ and $A_{CP}(\eta \bar{K}^0)$
- we get $\zeta_{(J)g} \sim \zeta_{(J)}$ and $|A_{ccg}| \sim |A_{cc}|$ as expected from SCET counting

$B \rightarrow K\eta$ vs $B \rightarrow K\eta'$

- is $\Delta S = 1$ so A_{cc} and A_{ccg} dominate
- large disparity between $BR(B \rightarrow K\eta') \simeq 60 \times 10^{-6}$ and $Br(B \rightarrow K\eta) \simeq 2 \times 10^{-6}$
- Lipkin '91: constructive and destructive interf.

$$A_{\bar{B} \rightarrow \bar{K}\eta'} = \cos \phi A_{\bar{B} \rightarrow \bar{K}\eta_s} + \sin \phi A_{\bar{B} \rightarrow \bar{K}\eta_q}$$

$$A_{\bar{B} \rightarrow \bar{K}\eta} = -\sin \phi A_{\bar{B} \rightarrow \bar{K}\eta_s} + \cos \phi A_{\bar{B} \rightarrow \bar{K}\eta_q}$$

with $\phi = (39.3 \pm 1.0)^\circ$, so that $\cos \phi \simeq \sin \phi$

- If $A_{\bar{B} \rightarrow \bar{K}\eta_q} \simeq A_{\bar{B} \rightarrow \bar{K}\eta_s}$
 - \Rightarrow a constructive interference in $A_{\bar{B} \rightarrow \bar{K}\eta'}$
 - \Rightarrow a destructive interference in $A_{\bar{B} \rightarrow \bar{K}\eta}$

$B \rightarrow K\eta^{(')}$ in SCET

- this very natural in SCET

$$\begin{aligned} A_{B^- \rightarrow \eta K^-} &\propto (\sqrt{2} - \tan \phi) A_{ccg} + \left(\frac{1}{\sqrt{2}} - \tan \phi \right) A_{cc} + \dots \\ &= 0.59 A_{ccg} - 0.11 A_{cc} + \dots \end{aligned}$$

$$\begin{aligned} A_{B^- \rightarrow \eta' K^-} &\propto (1 + \sqrt{2} \tan \phi) A_{ccg} + \left(1 + \frac{\tan \phi}{\sqrt{2}} \right) A_{cc} + \dots \\ &= 2.16 A_{ccg} + 1.59 A_{cc} + \dots \end{aligned}$$

- no cancelation between A_{cc} and A_{ccg} needed
 $Br(B \rightarrow \eta' K) \gg Br(B \rightarrow \eta K)$ for most $\arg(A_{cc(g)})/A_{cc}$)
- the suppression is much larger for A_{cc} than for A_{ccg}
- if $A_{ccg} = 0 \Rightarrow Br(B \rightarrow \eta K) \sim O(10^{-7})$ and not $\sim O(10^{-6})$

Enhancement of $B \rightarrow \eta' K$

- $Br(B \rightarrow \eta' K)$ enhanced over $Br(B \rightarrow \pi K)$ almost entirely due to A_{ccg}
- in SU(3) limit

$$\frac{A_{B^- \rightarrow \eta' K^-}}{A_{\bar{B}^0 \rightarrow \pi^+ K^-}} \simeq \left(\cos \phi + \frac{\sin \phi}{\sqrt{2}} \right) \frac{A_{cc}}{A_{cc}} + \left(\cos \phi + \sqrt{2} \sin \phi \right) \frac{A_{ccg}}{A_{cc}} + \dots$$
$$\simeq 1.22 + 1.67 \frac{A_{ccg}}{A_{cc}}$$

- other enhancements proposed in the literature were found to be either $1/m_b$ or $\alpha_S(m_b)$ suppressed
 - due to $b \rightarrow sgg \rightarrow s\eta'$ coupling from charm loop
 - the hard spectator contribution $b \rightarrow sg^*g^* \rightarrow s\eta'$
 - gluon condensate mechanism, ...

Further predictions

- we give predictions for observables in all $B \rightarrow \eta^{(\prime)}\eta^{(\prime)}$,
 $B \rightarrow \pi\eta^{(\prime)}$
- with observables measured so far the combination
 $\zeta_g - \zeta_{Jg}$ poorly constrained
- predictions for $\bar{B}^0 \rightarrow \pi^0\eta^{(\prime)}$ and $\bar{B}^0 \rightarrow \eta^{(\prime)}\eta^{(\prime)}$ fairly uncertain
- measurements in some of these modes will greatly improve on the knowledge of SCET parameters

S parameters in penguin dominated modes

$$S_f = 2 \frac{\text{Im} \left[e^{-i2\beta} \bar{A}_f / A_f \right]}{1 + |\bar{A}_f|^2 / |A_f|^2}$$

- interested in $\Delta S = 1$ where $A_f \propto \lambda_c^{(s)} P_{\bar{B} \rightarrow f} + \dots \Rightarrow$

$$S_f \simeq -\eta_f^{\text{CP}} \sin 2\beta$$

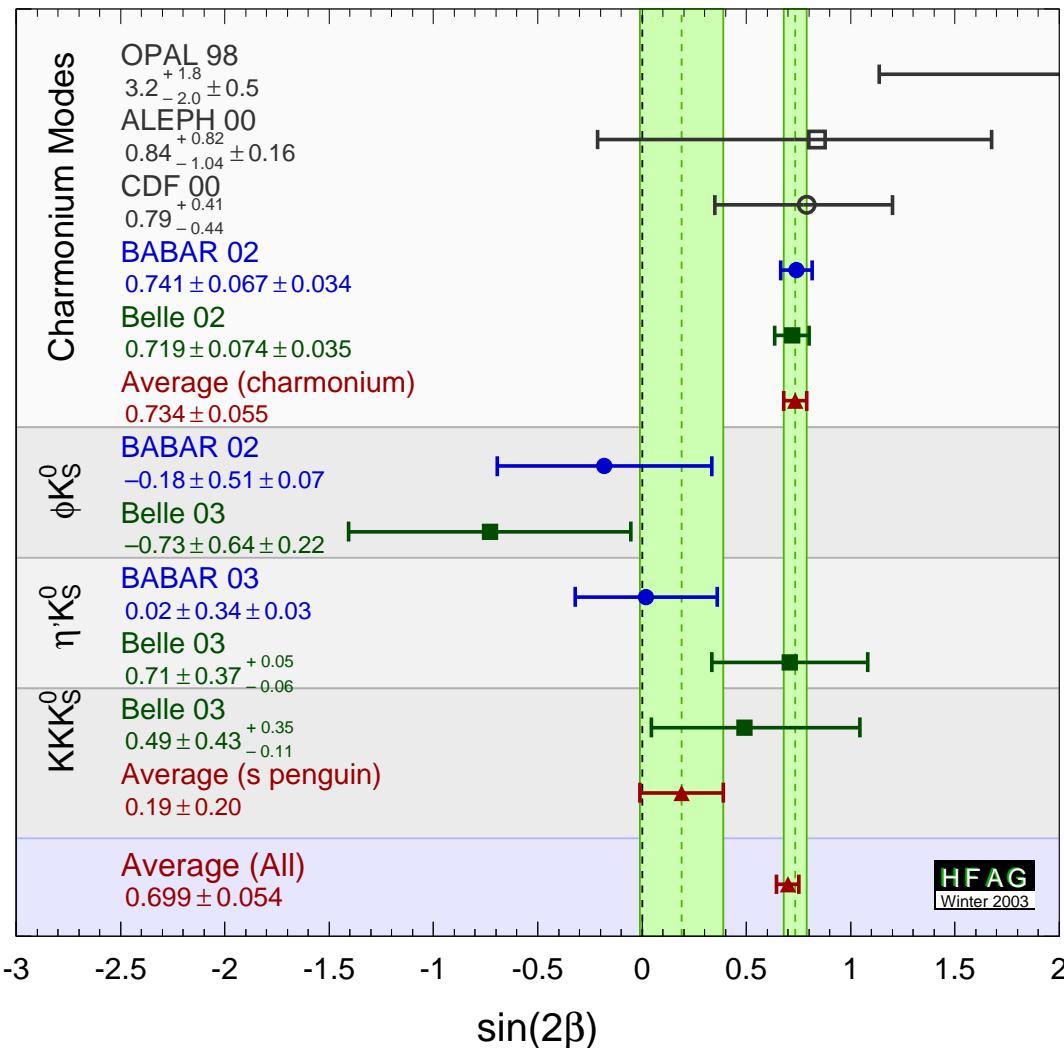

- more precisely

$$\Delta S_f \equiv -\eta_f^{\text{CP}} S_f - \sin 2\beta = r_f \cos \delta_f \cos 2\beta + O(r_f^2)$$

$$r_f e^{i\delta_f} = -2 \text{Im} \left(\frac{\lambda_u^{(s)}}{\lambda_c^{(s)}} \right) \frac{T_{\bar{B} \rightarrow f}}{P_{\bar{B} \rightarrow f}}$$

$$\text{with } -2 \text{Im} \left(\lambda_u^{(s)} / \lambda_c^{(s)} \right) \simeq 0.037$$

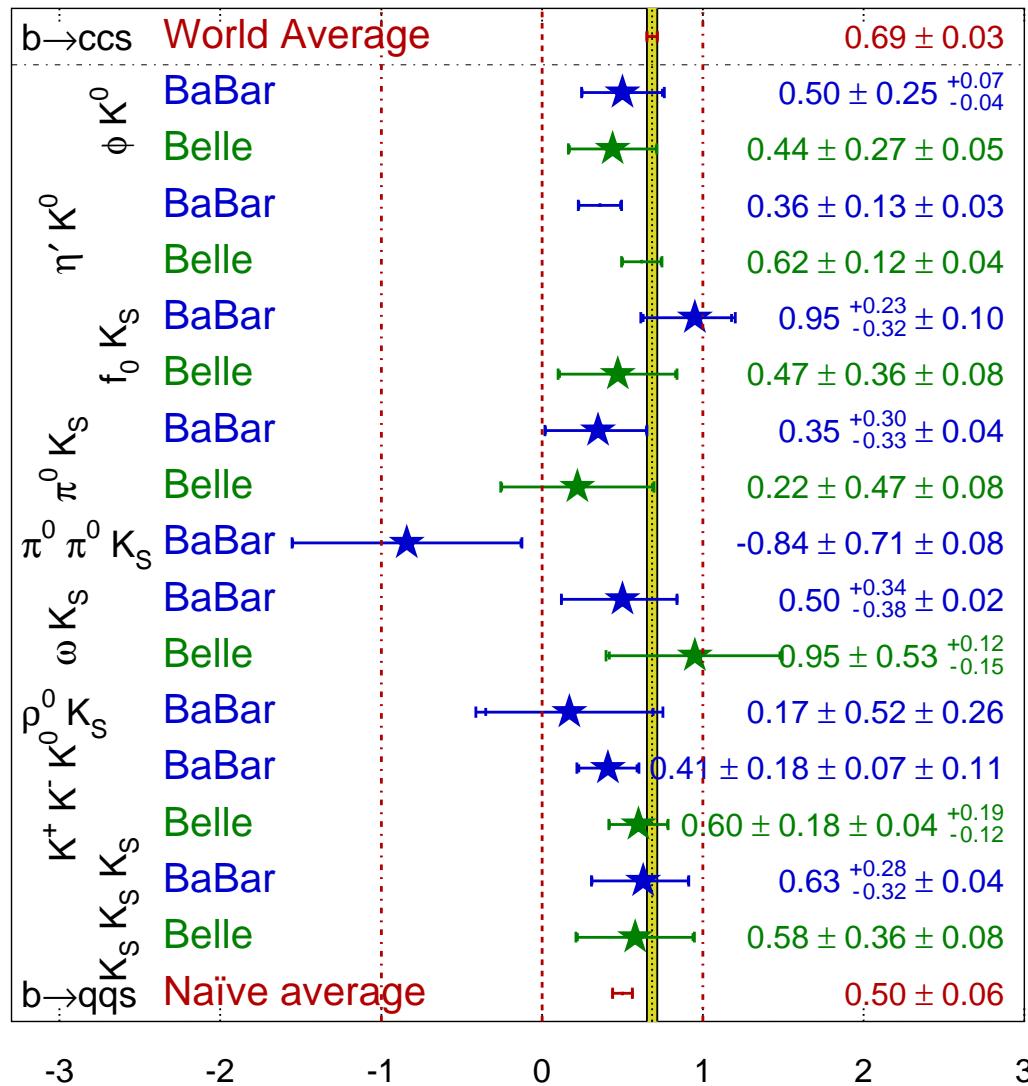

Winter 2003

Winter 2006

$$\sin(2\beta^{\text{eff}})/\sin(2\phi_1^{\text{eff}})$$

HFAG
Moriond 2006
PRELIMINARY

S parameters in $B \rightarrow \eta' K_S, \pi^0 K_S$

- using SCET parameters obtained from fit

$$\Delta S_{\eta' K_{S,L}} \stackrel{\text{Th.}}{=} \begin{cases} -0.019 \pm 0.008 \\ -0.010 \pm 0.010 \end{cases} \stackrel{\text{Exp.}}{=} -0.23 \pm 0.13$$

$$\Delta S_{\eta K_{S,L}} \stackrel{\text{Th.}}{=} \begin{cases} -0.03 \pm 0.17 \\ 0.07 \pm 0.14 \end{cases} \stackrel{\text{Exp.}}{=} -$$

$$\Delta S_{\pi^0 K_{S,L}} \stackrel{\text{Th.}}{=} (7.7 \pm 3.0) \times 10^{-2} \stackrel{\text{Exp.}}{=} -0.41 \pm 0.26$$

- S parameters not used in fit \Rightarrow pure predictions
- if strong phases δ_f are taken to be arbitrary, largest ΔS_f given by

$$r_{\eta' K_S} \simeq 0.03 \pm 0.01$$

$$r_{\eta K_S} \simeq 0.2 \pm 0.2$$

$$r_{\pi^0 K_S} = 0.14 \pm 0.05$$

B_s decays

B_s decays

- the time dependent decay

$$\Gamma(B_q^0(t) \rightarrow f) = e^{-\Gamma t} \bar{\Gamma}(B_q \rightarrow f) \left[\cosh\left(\frac{\Delta\Gamma t}{2}\right) + H_f \sinh\left(\frac{\Delta\Gamma t}{2}\right) - \mathcal{A}_f^{\text{CP}} \cos(\Delta m t) - S_f \sin(\Delta m t) \right]$$

- in SM: $(\Delta\Gamma/\Gamma)_{B_s} \stackrel{\text{Th.}}{=} -0.12 \pm 0.05$
 $(\Delta\Gamma/\Gamma)_{B_s} \stackrel{\text{PDG'06}}{=} -0.31^{+0.11}_{-0.10}$
- H_f can be measured even in untagged B_s decays

$$(H_f)_{B_s} = 2 \frac{\mathcal{R}e \left[e^{+i2\epsilon} \bar{A}_f (A_f)^* \right]}{|\bar{A}_f|^2 + |A_f|^2}$$

$$(H_f)_{B_s}$$

- for $\Delta S = 1$ decays

$$(S_f)_{B_s} = \eta_f^{\text{CP}} \sin 2\epsilon - \eta_f^{\text{CP}} r_f \cos \delta_f \cos 2\epsilon + O(r_f^2)$$

$$(H_f)_{B_s} = \eta_f^{\text{CP}} \cos 2\epsilon + \eta_f^{\text{CP}} \sin 2\epsilon r_f \cos \delta_f + O(r_f^2),$$

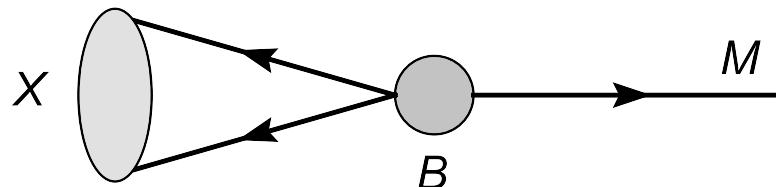

- $\epsilon \sim 1^\circ$ in SM $\Rightarrow 1 - (H_f)_{B_s} \sim O(r_f^2)$
 - even cleaner than $S_{B \rightarrow \phi K_S, \eta' K_S}$
 - for $\bar{B}_s^0 \rightarrow \eta\eta, \eta\eta', \eta'\eta' \Rightarrow |1 - (H_f)_{B_s}| \sim 10^{-3}$
 - for $\bar{B}_s^0 \rightarrow K^- K^+, K_S K_S \Rightarrow |1 - (H_f)_{B_s}| \sim 10^{-2}$
 - $(S_f)_{B_s}$ and order of magnitude larger
- BSM: same ops. important as in $B \rightarrow \phi K_S, \eta' K_S, \pi^0 K_S$
- $1 - (H_f)_{B_s}$ could be $O(1)$

Semiinclusive hadronic decays

Kinematics

Chay, Leibovich, Kim, JZ, unpubl.

- B decays to M and inclusive jet X back-to-back

- factorization as in 2-body B decays
- these decays simpler than 2-body B decays if
 - spectator does not end up in $M \Rightarrow$ matching to SCET_{II} trivial
 - work in endpoint region $p_X^2 \sim m_b \Lambda \Rightarrow$ SCET_I
- no dependence on ζ, ζ_J , the same shape and jet function as in $B \rightarrow X_s \gamma$, even this cancels in A_{CP}
- very clean probes of sizes of charming penguins

Which decays?

- the decays where spectator cannot end up in light meson
 - charged decays $B^- \rightarrow \phi X^-, \bar{K}^{0(*)} X^-, \phi X_s^-, K^{0(*)} X_s^-$
 - neutral decays
 $\bar{B}^0 \rightarrow K^{-(*)} X^+, \phi X^0, \pi^- X^+, \rho^- X^+, \phi X_s^0, K^{0(*)} X_s^0$
- measurement in the endpoint region \Rightarrow can sum over a finite number of exclusive modes
- also more inclusive measurements $\bar{B} \rightarrow \phi X_{u+d+s}$,
 $\bar{B} \rightarrow K^{0*} X_s$ interesting (and experimentally easier)
- work in progress, one result:

Soni, JZ 2005

$$A_{CP}(B^- \rightarrow K_S X_{d+s}^-) = 0.04\%$$

can be used as null test of new physics

Conclusions

- the LO SCET analysis has been extended to decays with η, η'
- πK and $S_{\eta' K_S, \pi^0 K_S}$ "puzzles" remain at $\sim 2\sigma$ level
- enhancement of $Br(\eta' K)$ is naturally explained in SCET
